Model Optimization and Tuning Phase

The Model Optimization and Tuning Phase involves refining machine learning models for peak performance. It includes optimized model code, fine-tuning hyperparameters, comparing performance metrics, and justifying the final model selection for enhanced predictive accuracy and efficiency.

Linear Regression

```
] from sklearn.model_selection import GridSearchCV

    'solver' : ['lbfgs','newton-cg','liblinear','sag','saga'],
    'max_iter' : [100, 1000,2500, 5000]
    }
]

] gs = GridSearchCV(clf, param_grid = param_grid, cv = 3, verbose=True
```

```
] gs = GridSearchCV(clf, param_grid = param_grid, cv = 3, verbose=True

] best_clf=clf.fit(x,y)

] print("Accuracy - :",{best_clf.score(x,y)})

Final Model Selection Justification (2 Marks):

Final Model	Reasoning
Gradient Boosting	The Gradient Boosting model was selected for its superior performance, exhibiting high accuracy during hyperparameter tuning. Its ability to handle complex relationships, minimize overfitting, and optimize predictive accuracy aligns with project objectives, justifying its selection as the final model.
